AXLE CENTRE.

R.C.N. AXLE BOX.

Adams chimneys and domes M.R.N JUNE 1936. dwgs

Auto Couplings. See under Jackson.

FOR 15 mm CENTRE GAUGE USE CROSSED OUT SIZES

BUSH = ·62
TUFNOL = ·~~66~~
SPANNER = ·~~330~~ ·315

'0' SIZES IN RED

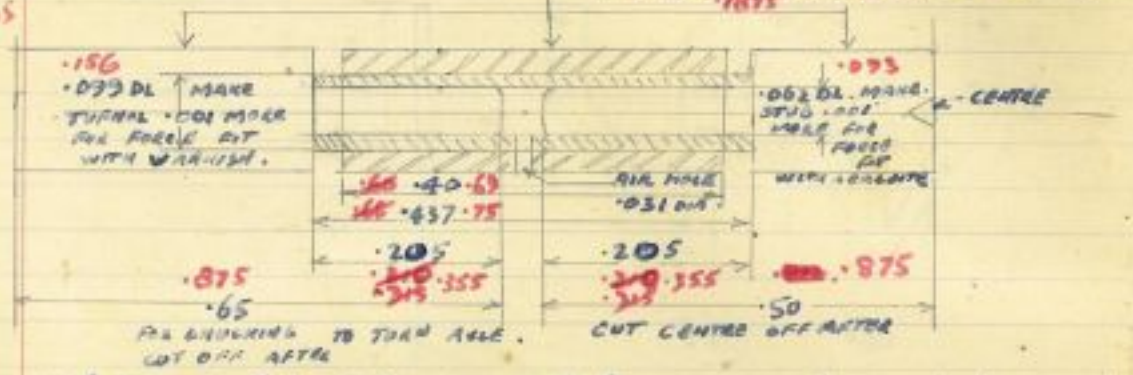
3/16" DIA FOR '0'
1/8" DIA FOR 00.

·218 OR ·203 (5 MM JUST POSSIBLE WITH CARE)

AXLES (SPLIT) ·156 OR ·140 MAT^L M/S. (OR 3·5 MM)

TURN TO ·115 AFTER ARALDITE HAS SET.

·1875

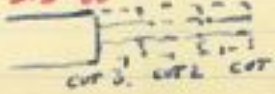


NOTE:- BE CAREFUL TO MAKE BOTH ENDS EXACTLY EQUAL IN LENGTH WHEN FINISHED TO TAKE MAX POSSIBLE AXLE PLAY.

Method. Machine stub axles and bushes. Use depth stop when 'ending up' to length and machining stubs to ensure uniformity.

To get correct projection of T-fuf bush, make the T-fuf blanks ·450 long (~~·686~~ ·76) then, after fitting, and before drilling, turn end and to length by setting top slide to 0, touching up to the steel bush and turning back ·02" (60 setting) to face the end ·02 proved. ·03 (50 SETTING)

Turn T-fuf for ·50 length in three equal cuts of ·166 (2 turns of top slide) for support. ~~·205~~ ·80 ·25 ·3



Part off by fretsaw.

After bushes are fitted with aluminium varnish, CAREFULLY centre with ~~3000~~ centre drill, drill ·052 thru ~~·078~~ ·093 use cut to ·062. If the hole starts accurate, it will run true.

NOTE:- ·093" IS THE ·092 HOLE IN A 3 mm DRILL ~~·0955"~~ HOLD ~~·0995~~ ·093"

Drill the hole by putting bush on ·062 steel rod chucked at centre height in tool post. OK if drill is sharp and run gently.

Assemble with nut and in collet with depth stop support and ⅛" dia axle in chuck in tailstock. Use carbide. Finally turn to length of ·~~750~~" which will accomodate Gibrin wheels ·125 thick bore and 16·75 back to back in EM (18·20 mm or 17·75 back-to-back ~~EM~~ P4.

'0' gauge. make ~~1·50~~ 1·60 long blanks. to cut to length as required.

Method of manufacture ('0' gauge)

Half axles turned down to size in 3 cuts + ·03 finish cut using a honed ⅛" square tool with slight nose radius (sketch). Length set by initial. Actual size of shank to aim at = ·0925/·0930. FOR ·0915/·0910 BORE ~~FORCE FIT MUST BE ·0915~~ ~~·0910~~ AIM FOR ·0930 GIVING. ·001 FORCE FIT MIN ABSOLUTE.

facing cut and final part-off. Bushes drilled by 1/8" slocomb followed by .140" and .156" drills in turret with length set by initial face-up and part-off. The .156 drill was .1556" actual and produced a .156" bore. Both drills were very carefully sharpened and in new condition. The .140 hole was taken out in two settings of .375" length, the .156 being used in between to give my a swarf clearance. Bush ends were cored by hand using 60° c/sink plus 120° drill. Bushes were well washed to remove cutting lubricant. (50% ejne oil 50% paraffin).

Press bush in using 1/4" x 7/32" recessed bush with length stop

Tufnol inserts cut by box cutter with a trace of oil to reduce rubbing friction. Diameter = .1569/.1570. Pressed into bushes by tailstock with .03" plate as a gauge to ensure correct projection. Armature varnish squirted into bush with Tufnol just inserted. Drilled out using 1/8" slocomb and 7/32 (actual = .0928") drill in turret. Drill .031 air hole with bush on steel mandrel in tool post.

Assembly - Use end stop. Push bush at least half home on stub axle in collet using back centre. Then push other stub in using back centre. Withdraw back centre before spinning lathe or collet will seize due to assembly pressure. Pull off excess adhesive with fingers.

Final turning: Use power traverse 2 cuts + finish. Part off ends using stop in collet.

SEE NEXT PAGE FOR SIMPLE SPLIT AXLES (4MM).

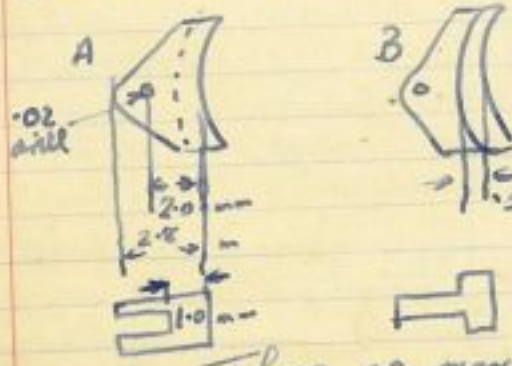
BRAKE BLOCKS - GENERAL STOCK - (1/16" INSULATION BOARD OR BRASS should be thinned to .055 to make.

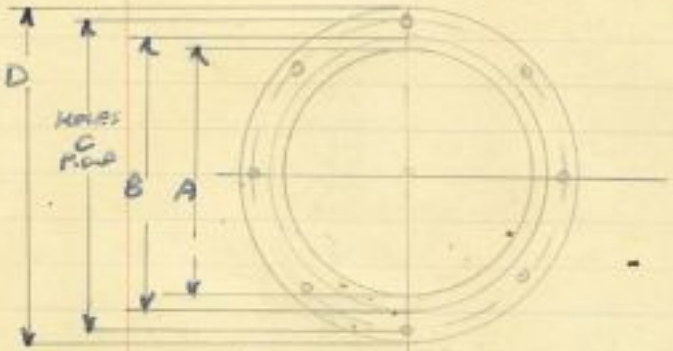
In general, a 4-way block is 7mm overall MAX. It may be single Ranger (about 60% of prototypes) or double Langer (about 40% of prototypes). Other dimensions are as shown.



These are maxima (except ·50 mm of B which is min).
If stock rings are turned to these sizes and blocks cut off, they can be filed down on the ends or face or shaped in other ways.

See one for for stock ring sizes for 14, 18, 22 and 2
blocks covering 12/16 16/20 20/24 24/28 mm shoes.

N.B. Brake blocks OUGHT to be about .055 thick for cycle wheels. not .062



A	B	C	D	NO OF SEGMTS
(14) .551	(15) .590	(18) .709	(19.6) .772	6
(18) .709	(19) .748	(22) .866	(23.6) .929	7
(22) .866	(23) .906	(26) 1.023	(27.6) 1.087	9
(26) 1.023	(27) 1.062	(30) 1.181	(31.6) 1.244	10.

Method 1) drill blanks for .218 either end then in slow 2 at a time.
2) For type A, mount in slow 1 at a time and turn in a slot in rim
3) For type B, turn down end side to leave .035 land in middle
4) Open out bore.

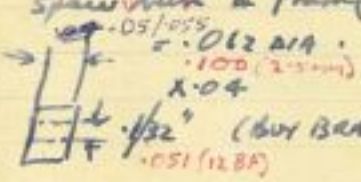
a) divide in thirds, drill .02 drill. b) with narrow pointed tool, then use a 0.015 fretsaw to deepen this slot to take the hanger

The above assumes 8 mm per blank & allows 1 mm waste when sawing off the rings.

Brake hangers are 2mm x .012 N/S strip suitably filed to shape after drilling. Pins are .02 ~~hill pin rivetted~~ N/S wire cropped off and rivetted.

OUTSIDE (DOUBLE) HANGERS

"C" GAUGE IN USE.



O.K. Checked

ALSO Use same bushes as spacers between double hanger at the top (16SH) and BUT make .03 thin.

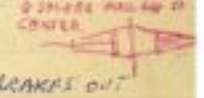
Brother 'O' gauge bush.

BRAKE STRETCHERS

.04 SRPB .062

A SIMPLER METHOD IS TO SOLDER A WIRE ON BEFORE CUTTING THEN FILE CENTRE AWAY

RIVETTED OVER & SOLDERED TO COPPER

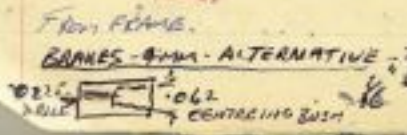


SPACER HANGERS

USE .015 THICK HANGER. THE BUSH IS THEN .075 LONG TO SPACE THE BRAKES OUT FROM FRAME.

.130

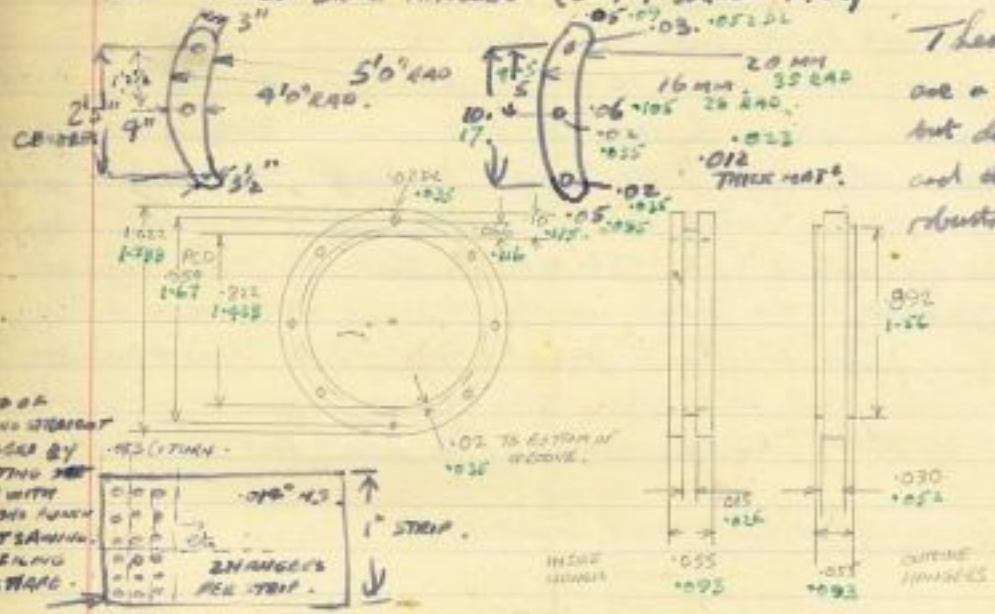
.025



BRAKES - 8mm - ALTERNATIVE

See over for "0" gauge longer. for Patrick

MIDLAND LOCO BRAKE HANGERS (0-4-4 JOHNSON TANK)



These dimensions are a little above scale but don't seem too bad and may give a bit of robustness. 7 mm in green.

4mm SCALE IN RED
7mm SCALE IN GREEN.

Make bore equal to crank dia.

METHOD OF MAKING STRAIGHT HANGERS BY PUNCHING STRIP WITH CENTRE PUNCH & FRET SAWING ONE SIDE OF FILING ITEN STRAIGHT.

BRAKES (WAGON) A comprehensive series of articles with drawings in the "Link" June, July and August 1981

BOILER MOUNTINGS (SEE ALSO NEXT PAGE FOR MIDLAND)

CHIMNEYS (4 mm). NORMALLY FITTED WITH 8BA SCREW, COUNTERBORED ·1875 & MACHINED ON A ·1875 MANDREL. COMED IN BORE AT TOP TO GIVE SCALE RIM THICKNESS.

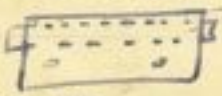
DOMES (4 MM). TAP 6BA AS DEEP AS POSSIBLE BUT FIRST, CENTRE, DRILL ·051 & SPOT FACE BASE ·1875 USING THE PILOTED CUTTER FOR OPENING OUT FRAME HOLES. THEN MOUNT ON ·1875 MANDREL WITH 6BA SCREW THROUGH, LOCK UP & TURN.

"0" gauge. Take ·1 and use ·250 mandrel. (OR 2½ ·120 MANDREL)

SAFETY VALVES (MIDLAND). AS FOR CHIMNEYS BUT 10BA SCREW WITH HEAD REDUCED IN DIA BECAUSE ONLY AS SMALL BORE IS POSSIBLE.

BRAKE PULL RODS (LOCO)

FROM ·04" X ·01" STRIP. DRILL ·02". FILE DOWN TO ·03" BETWEEN HOLES USING FILING JIG IN DRAWER.



GRIP IN VICE.

Brake Hangers (Patrick) "O" Gauge. The loco has double hangers, the LMS 3500 gall tender, single brake hangers.

In the box of brake hangers are sets of filing buttons Ø 0·115 dia, 0·098 dia and 0·09 dia. both with 12BA & 16BA screws. Method is to lay out ONE hanger (·017" double, ·022" single). by drawing the radius at which the holes are to be located and centre popping VERY carefully. Then drill the fixing bolt hole, ·052" and the block and pull rod holes ·031". ~~Then the~~ For the tender, use the ·09 jig at each end and the ·098" jig in centre and file to jigs. For loco - ·098" (top) ·115 (centre) and ·09 (bottom pull rod). Drill ·052 holes in sufficient plate and drill all the others from the master. Then file, two at a time.

BOILER MOUNTINGS (DOME, S/V, CHIMNEY) MIDLAND

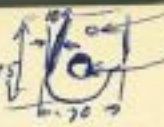
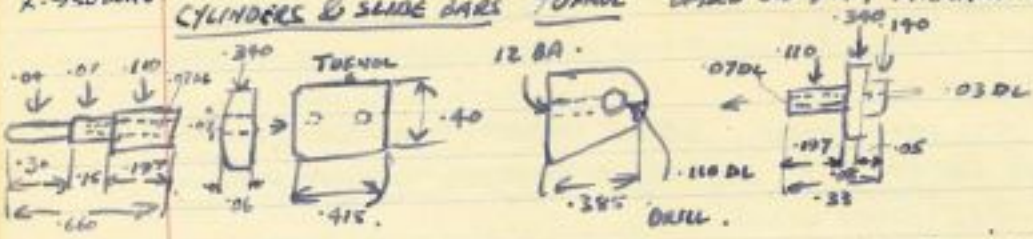
GW CYLINDERS SLICE FROM 7/8" SQ TURNOL 0" GAUGE MACHINED TO .700 WIDE. X-SECTIONS



MOUNT ON FACE FITTED 1/4" DIA BRASS ROD WITH CENTRE AT OUTER EDGE THEN MILL RADIUS BY INDEXING 55T WHEEL AND MILL 10° TUMBLE HOLE BY INDEXING 1 TOOTH (= 10°) PAST VERTICAL.

CYLINDERS & SLIDE BARS TURNOL BASED ON 4 MM MIDLAND COMPOUND.



Machine 2 blocks per loco of Turfol making sure the lamination go across the cylinder. (.40 x .415 x .385) Find size but I made them such that the .110 drill (cylinder centre) was in the centre as block WAS .46 x .46 is convenient to start with. Centre found by using marking gauge from all four sides. Centre popped and set up in chuck with wobbler and drilled .110. Then blocks reduced by amounts needed to give above (e.g. .460 - .385 = .075; .460 - .400 = .060) Blocks then bird up in place on frame and clamped and drilled for 12 BA and tapped. Then two hardened washers .340 put on 6BA bolts thro' .110 hole and cylinder filed to radius and slope inside. WATCH HANDING.

FRONT & BACK COVERS & TAIL RODS machined from MS

Front cover drilled in dividing head at .192 centres x .057 drill for slide bars, then Araldited to cylinder block. When set, drill cylinder block through cover .052" using cover as jig. Use pillar drill.

SLIDE BARS From .051" dia MS. Use a filing rest in tailstock (keep in small tools tin)  (Drill .052 and file down nearly half way.

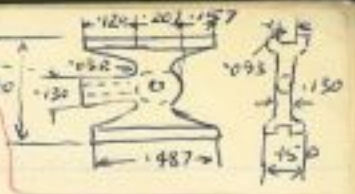
File to .038 x .035" using 40T wheel on index plate on lathe spindle Araldite bars in place.

CROSSHEADS. From 1/4" NS turned down to .218. Machine each end of bar for fit thro'.

1) Recess with cutter (in small tool tin) and drill .027 for .028 rod
2) Set up in dividing head and mill slide bar slots using .04 fly cutter in watch lathe 3 jaw to leave width between slide bars (.160) Because we haven't got Two 1/4" collets
3) Mill sides to .07" using 1/4" slot mill in watch lathe chuck
4) Mill recess for con rod small end .05 deep using .110 slot drill held in watch lathe collet.
(N.B. using watch lathe chuck + collet because 1/4" collet is in dividing head).
5) File smoothed & shape.

NOTE. THERE WAS NO TROUBLE IN MILLING "O" GAUGE FROM 7/16" BAR. PROVIDED ALL WAS TIGHT AND THE PISTON END WAS SUPPORTED BY CENTRE IN OVERHANGING ARM OF DIVIDING HEAD.

"O" GAUGE GWR 51xx



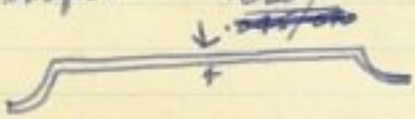
(crosslead continued).

THE HOLLOW CUTTER PLUS TWO 3/32" SR MEASURING PINS IS USED TO MEASURE OVER SLIDE BAR. SLOTS 45 IN THE PACKET ENABLES 4-4-0 COMPOUND CYLS.

ROUNDED END OF HOLLOW CUTTER FOR GWR LOCO.

use the hollow cutter - ·055 deep in end of bar to give ·07 bore and ·125 dia recess.

after milling, use knife file (ground in back) to file back of slot to taper shape.



Coal Rails

Fret out 2 (or 4) from ·014 N/S. soldered + form a stack and file.

Use 1mm Left round brass for structure (or 7mm ⊥ if available)
Solder in the brass rails from ·030 x ·01 strip.

CRANKPINS (SEE ALSO PREVIOUS NOTE)

Fitting. If pin is ·052", drill with ·051" drill (THIS APPLIES TO PLASTIC WHEELS AS WELL) Hold pin in blunt tweezers and nibble length then put in No 3 collet and turn off to desired length (·150 for wheel ·10 dia with ·046 thick rod). Tap in pin from front of wheel using drift with ·031 hole. Use a ·051 thick spacer plate (both drift and plate are in washing box). Tap in a hole bed and use little bed as stop if pin protrudes at rear. Smear Loctite in holes of plastic wheels.

CHASSIS AXLE GUIDES

FOR 3/32" TENDER AXLES

A = ·1875
B = ·190
C = ·093
EM/P4/00.

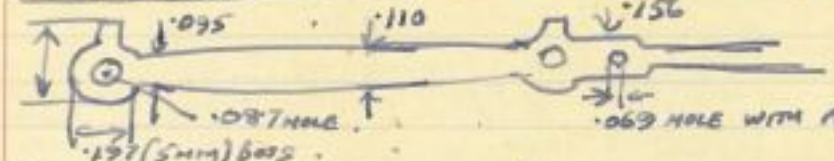
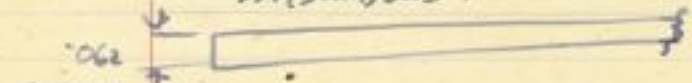
1) N.B. "C" VARIES AS SIDE PLAY IS CALLED FOR
2) NB. FOR EM/P4 USE ·036/·030 THICK SIDE FRAMES. FOR "00" -·02 (SMALL CLEARANCE) FOR "O" GAUGE USE ·04 - ·06.

ACTUALLY MADE BY VU

COUPLING RODS "O" GAUGE. - PATRIOT (ALTERING CBW SOLID RODS.





FOR ALAN HARNI WHEELS, USE THE NORMAL ·093 DIA CRANK PIN.

1) Actual bosses should be ·08 through
2) Wednesbury wheels crankpins are ·110 in dia so hole needs to be ·114
Method of modifying.
~~3) Open up all big ends to ·110 hole.~~ 3) Drill ·05 HS plate ·087 off the hole
4) Turn up big end bushes  and pivot bushes 

2) Open up all big ends to ·140 hole. and gun up plate hole to ·140
4) Temporarily fit pivot bush in one rod & drill ·051 holes from rod

 — leave enough plate to provide oil boss when filed to big end shape.

5) Fit steel plug  to pivot hole & fretsaw round it to cut rod in half.

6) Temporarily fit large bush in big end & file in the half rod. Also, cut off to give flat.

7) Slot big ends by two cuts with ·01 fretsaw, leaving web on the back of rod. Clean with ground down knife file.

8) Fit tongues by pressing in bush & sweat.
9) Fit pivot bushes, solder, file to shape & slot as above, testing till tongues go in.

CYLINDER RELIEF VALVES - GW See Relief valves.

i) Fit other big end and saw and file all to shape
ii) Make joint pin 

in steel, fit and rivet.

BUT BEFORE RIVETING, draw file, clean and polish the rods.

EM COY/COUPLING RODS BASED ON GWR SET FOR TIM STANTON

1 Generally as Midland. (See previous) Use ·05 steel sheet. Drill ·051 for crankpin ·031 for knuckle. Use ·08 die filing jig for knuckle & whatever is correct for big end.
2. Having filed big/little ends, put in vertical slide and mill away metal between with 3/16" slot mill (FOR ONE OF PAIR ONLY). Then file to size in toolmaker's clamps AND BOLT TO SECOND BLANK AND FRETSAW SPARE METAL AWAY USING FIRST ROD AS GUIDE)
3) Use 3/16" Square brass (in drawer with Midland jig) for filing sides drilling brass from rod and using suitable (·01) packing beneath for 2nd side. Generally, the metal is ·098" thick so file off ·01 and measure across rod at jig. This will give the SAME overall figure for BOTH sides
4) ~~Set rods~~ Set rods on side in vice in vertical slide & drill for ·093 (VERY SHORT, DEAD TRUE DRILL IN ECLIPSE CHUCK, NO NEED TO CENTRE) Then force in ·02" M/S WIRE, CUT OFF AND FILE TO REPRESENT OILER.
5) Complete knuckle by drilling inside tongue ·032, outside tongue ·0315 and using ·0315 steel welding wire as rivet
6) Cut outside fork using ·018 fretsaw and file inner fork to fit at same time as rod sides are cut.

CAB WINDOWS (SEE WINDOWS - CAB)

DAS modelling medium. See drystone walling.

DOMES SEE BOILER MOUNTINGS.

DRYSTONE WALLING USING DAS.

Cut @ .093 card 5/8 high. ▭ - round top → make top uneven.

Tack a straight piece of wood/tufnol on board, put strip against it

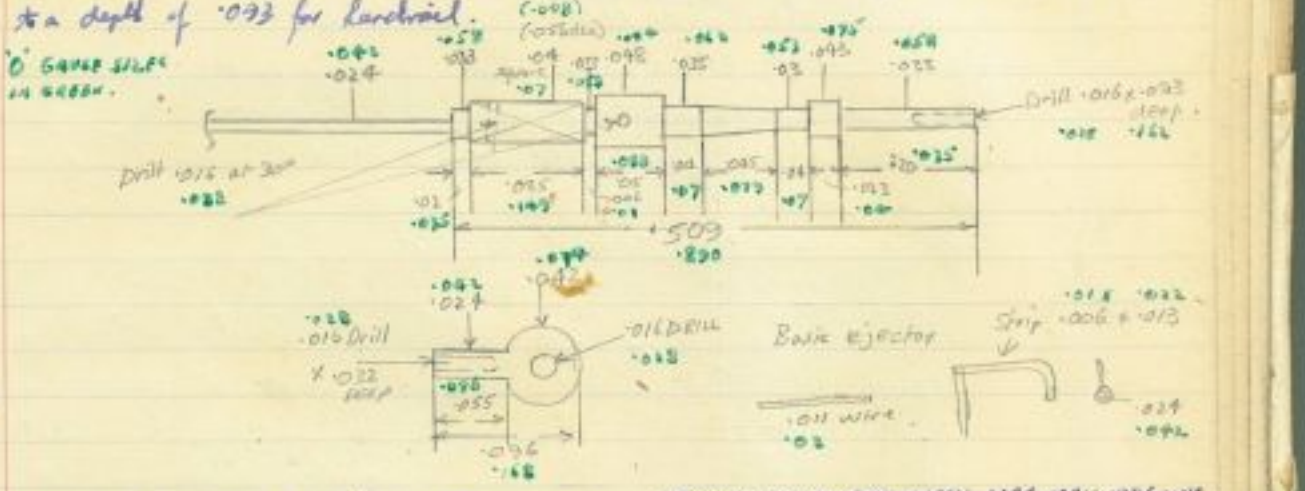
use double sided tape on card. Apply Das rolled to about 3/16" dia to centre of tape and flatten with putty knife to cover. Allow some to overlap top edge. <u>Moisten putty knife on wet cloth, also fingers.</u> When side covered, turn over and flatten down on wood/Tufnol strip. Also cut off with scalpel, the excess on the wall base. Lay down on covered side and repeat for the second side using the putty knife to unite the surplus Das with that protruding from first side to ensure covering of wall top. Again flatten and trim excess from base. Now mould the top round by hand. Leave for 1/2 to 1 hour then, using the ·01 top ~~[illegible]~~ cutter  in loco tool box

indent the top stones. Then with blunted penknife (in wagon tool box) cut horizontal lines ROUGHLY, straight and use a "dabbing" motion to break the lines a bit. Then go along with knife point "stabbing" the verticals unevenly till all wall is covered. Turn over and repeat. Leave 24 hours to set. Clean up base on coarse sandpaper.

Efficiency of model locomotives. Major Sheppard M.R.N. Feb 1942
" " " " A.F. Webbe "Tractive effort" March 1943.

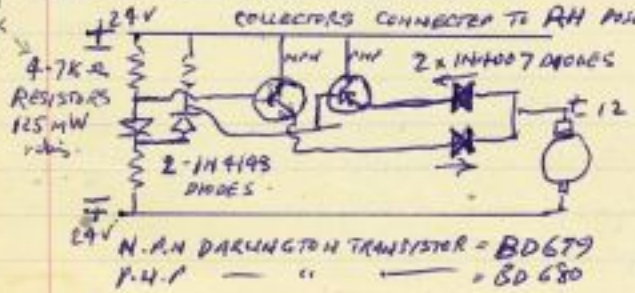
Ejectors (Midland-Johnson).

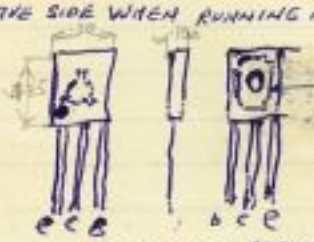
These are fitted on RH to 2·0" dia pipe with fittings screwed on. In model form, take ·024" wire and slip a length of NS drilled ·029 over it and solder then turn the NS as drawn and drill the end of the assembly ·016" to a depth of ·093 for hardrail.



ELECTRONIC VOLTAGE DIVIDER 24-12 VOLTS.

ORIGINAL DESIGN - PETE CURRY MAR-MAY 1986 LMR.
MY VERSION REVISION - FEB 1987 LMR.





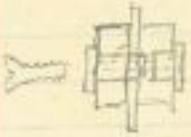
When top (RH) rail is positive, current flows thro' LH diode giving +12V for base of N.P.N BD 679. RH diode blocks any current flow through RH resistor so base of P.N.P = 24 V, BD 680 is reverse biased and is switched off because nothing can flow through top diode IN4007. Reversing polarity of tracks switches N.P.N off, switches P.N.P. on. so motor is reversed. Different voltages at motor could be arranged by choosing different value of voltage divider resistors.

The two darlington transistors can be mounted on a heat sink (·02 copper) and the metal face contacting the heat sink which is made positive. The collector lead on the transistor is then redundant and can be cut off

In the event of failure, disconnect from motor and check voltage output from each transistor. Also, check across electrolytics. The 2-2-2 might only run one way. It was found that one 4148 diode was not conducting in the forward direction. It was replaced and all seemed well. On first 'wagging' the wire made it conduct intermittently so obviously it had broken inside.

Electronic voltage divide continued.

10 or 12 BA screw →



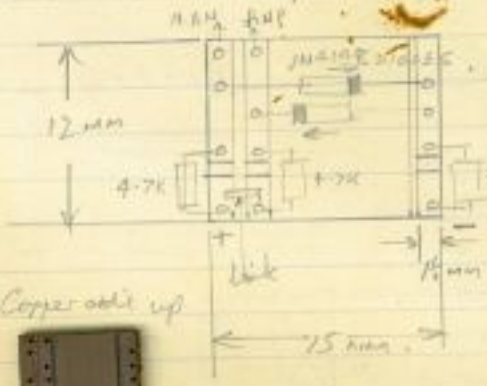
The brushes can be Tufnol if insulation of motor is needed or brass if close is no close by screw shaft body of motor. One end can be tapped or screw can go right through for bolting to a bracket, either tapped or nutted

Heat sink - large as possible

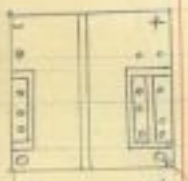
One method is to fit a heat sink bracket to R.H. (positive) loco frame and to mount the transistor sheets either back to back or one above the other, inside tank, tender, bunker etc or between frames. (with lead weights bolted on as weight plus heat sink). The bases are then fed via fine tinned lead from printed circuit. The two IN4007's are joined and a common lead taken to +ve of motor. Negative of motor is taken to terminal block or negative frame (VIA a 10Ω or 22ohm resistor to protect stalled motor).

IN 4148 →|

IN 4007 →|



'Printed' circuit. Actually, make as a long strip with the gaps cut along then saw off to make separate boards. Drill holes .024" at 5/8 mm spacings for resistors. Set out and drill one board and use as jig for rest.



THE CIRCUIT IN 2-2-2 SHOWN.

Copper side up

P.W. TO CHASSIS

Mount motor frame by brackets bolted OUTSIDE FRAME By frame screws (See Johnson 0-4-0T and 0-6-0 half cab) In the case of the Johnson 0-4-0T, the two transistor are also mounted on the board by a 10 BA screw. The bracket legs are soldered across the bottom 3 mm of the board and a further gap cut up the middle to make one half of the middle +ve as feed for the collectors.

The Hornby 0-4-0 tank has the full width of the frames to play with and so has a special horizontal 'printed' circuit fitted round the motor. It carries the transistor and is plugged into four sockets for +ve and negative by means of pins soldered in the board. It could be wider but has to slide up between the outside frames in this case.

Etching. M.R.C. May 1973.

Notes: Use pyrex to avoid attack.
Use rubber gloves. USING BLICK OR LETTRASET.

Materials.
Hydrogen peroxide (30% W.V. or 100 volumes) quantity 100 ml
Hydrochloric Acid (25% concentration) 100 ml. } enough for 4 plates.
Nail varnish
Nail varnish remover or acetone
Small ink rubber
(This relates to copper sheet but try brass).
Metal sheet clean, dry, flat. Scrub clean with kitchen pad.
Don't press letters too hard or wax may be put on the metal. Rub letter through a glassine sheet of paper.
Paint border or other protected area with nail varnish or use blick lines. Varnish over blick lines anyway to prevent lifting.
Cover excess copper with nail varnish to protect for re-use.

BAKE the sheet at 60°C (140°F) for 30 minute minimum. This improves adhesion of letter and sets the varnish. Higher temperature may cause the letters to peel. If no thermometer use lowest stove setting.

Prepare etch immediately before use. Reaction it goes off.

Quantities = 3 measures of water (75 ml).
then 1 measure of Hydrogen peroxide (25ml)
then 1 measure of hydrochloric (25 ml)

The correct etch solution should effervesce slightly like lemonade.

Put copper sheet in etch. If varnish with a bit protruding it can be withdrawn for inspection and washing. If too vigorous, add water. Etch for 15 min or until letter lifts off. Rinse thoroughly. Dry on paper tissue. Remove lettering and varnish with acetone. Blacken background with black felt tip and polish surface with ink rubber

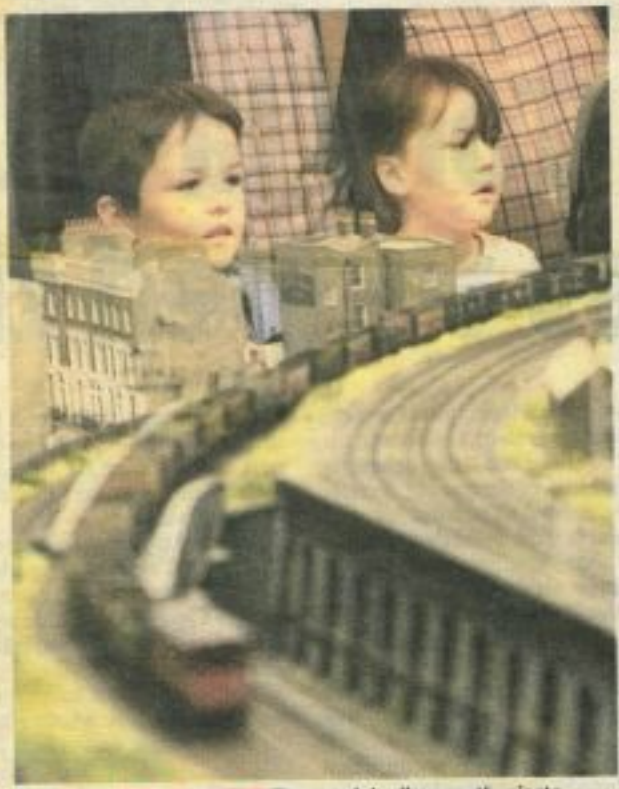
4,500 TURN OUT FOR SOCIETY'S ANNUAL EXHIBITION

LOCO COMMOTION A young model railway enthusiast gets a close look at one of the displays at the exhibition Photographs: Constantine Tofalos



FULL STEAM AHEAD Two model railway enthusiasts watch as a train shoots past them on one of the displays

All aboard for model railway fun

IT WAS full steam ahead for train enthusiast as they rushed to Manchester Model Railway Society's 70th annual exhibition.

More than 4,500 people turned up to see the displays on show at the three-day event at New Century Hall.

The exhibition included a display of the Bachmann Branch-Line, plus track layouts of The Gresley Beat at King's Cross and the 37th Street Yard in New York.

Sidney Stubbs, president of the Manchester Model Railway Society, said: "The show went very well.

"Visitor numbers were up on last year's exhibition and there were some fantastic displays."

MAN EVENING NEWS SEPT 23 2000

Guardian of a bygone age

Stan's 70 years as a model rail enthusiast

Exhibition to draw fans from all over world

TERRY JOHNSON

NEARLY three quarters of a century has gone by since Sid Stubbs was bitten by the railway modelling bug.

Back then, he was a fresh-faced 15-year-old, captivated by an era of grit and steam. And while the original old railway companies like the LMS and LNER have long gone, the excitement of making intricate replicas of these mighty engines and early rolling stock has not diminished for Sid.

EARLY DAYS the society held its first exhibition in 1931

The 85-year-old, from Chorlton, Manchester, is President of the Manchester Model Railway Society, which he dreamed of joining by his 16th birthday.

His name now dominates railway modelling because of the high standards he set and his pioneering work.

The society celebrates its 70th annual exhibition at New Century Hall, Corporation Street, from September 29-October 1, and enthusiasts from all over Britain and overseas will be attending.

One of the oldest amateur societies in Manchester, it held its first exhibition in 1931 in the Lever Street Sunday School. There were no exhibitions during the war years. Over the years, the groundswell of interest has made it the longest running model railway show in Britain.

» **DISTINGUISHED SERVICE** Model railway enthusiast Sid Stubbs with his 1890s model railw attic of his Chorlton home Picture: Christian Bragg

The Manchester show will open on Friday, 5-9pm; Saturday, 10am-6pm; and October 1, 10am-5pm.

Admission prices are: adults, £5.50; juniors, £3; seni £4.50; family ticket (2 -

Tickets also via th www.mmrs.co.uk

Relays for "0" gauge Jackson Couplings.

26 s gauge wire (·018). 50·6 turns per inch = ·02" over enamel
resistance = ·0944 ohms per yard.

Coil details. Core = ·375" (assumed. could be ½" or over)
Top dia = ·875"
Length = 2·375"

Then. mean coil dia = $\frac{·875 - ·375}{2} + ·375 = ·625$"
and mean circumference of 1 turn = $\pi \times ·625 \simeq 2·0$"
or 6 turns per foot.
Number of turns in one layer = 2·375 × 50·6 = 120
Number of layers = $\frac{·875 - ·375}{2} = ·25/·02 = 12·50$
Total number of turns = 120 × 12·5 = 1500
Footage = 1500/6 = 250 ft or 83·33 yds.
and total resistance = 83·33 × ·0944 = 7·866 ohms.

28 s gauge wire (·0148) 61·4 turns per inch = ·0163 over enamel
resistance = ·1398 ohms per yd
Number of turns in 1 layer = 2·375 × 61·4 = 145
Number of layers = ·25/·0163 = 15
Total number of turns = 145 × 15 = 2175
Footage = 2175/6 = 360 ft = 120 yds
Total resistance = 120 × ·1398 = 16·776 (17 ohms)

30 s gauge wire (·0124) 73·3 turns/inch = ·0136 over enamel.
·1991 ohms per yd.

over.

number of turns in 1 layer = 2·375 × 77·3 = 174
number of layers = ·25/·0136 = 18
Total number of turns = 174 × 18 = 3132
Footage = 3132/6 = 522 ft = 174 yds.
Total resistance = 174 × ·1991 = 35 ohms.

Current	12 volts	24 volts
26s	1·52 amps	3·05 amps.
28s	·70 amps	1·40 amps.
30s.	·34 amps.	·6865 amps.

In other words going down 2 gauges.
Doubles the resistance and halves the current.
and in terms of Wattage, halves the power (watts)

On the basis of my own coils, using above sizes
32s gauge would give 70 ohms and 39s 140 ohms.

32s wire (·0108) 83·0 turns per inch. (·0120 over enamel).
Number of turns in 1 layer = 2·375 × 83 = 200
Number of layers = 20
Total number of turns = 20 × 200 = 4000
Footage = 4000/6 = 666·6 ft = 222 yds
Total resistance = 222 × ·2625 = 58 ohms.

34s wire (·0092) 98 turns per inch = ·0102 over enamel
Turns in one layer = 2·375 × 98 = 230
Number of layers = ·25/·0102 = 24
Total number of turns = 230 × 24 = 5520
Footage = 5520/6 = 920 = 300 yds
Total resistance = 300 × ·3617 = 108·51

·02Ω wire. Dropper = 2mm above rail
100Ω works at 12 volts · ·12 amps.
with the armature under the sleeper Peco Track
= 9½ mm distance from dropper 7½ mm from base of track level.
It does not uncouple whilst being pulled.

However 100Ω at 24 volts = ·24 amp does uncouple whilst being pulled.

By screwing in the 4BA button and lifting it just below sleepers, the whilst will uncouple on being pulled even at 12 volts
This reduces dropper to coil distance to 6½ mm.
Could put a resistance in series with the coil and adjust to suit all cases.
Putting in a 1" long 4BA extension to the coil makes no difference to the above
However, withdrawing the coil downwards (by using sheet plastic) does make a difference in between.
as one would expect as the magnetic gap is increased.

All above were on wagons having a coupl

length of 5". Coaches might well be shorter and, of course, axle height is higher. Even so, there should be sufficient "pull" to work the coupling and sufficient "drop" to uncouple.

Extract from "MOORES MONTHLY MAGAZINE" (Locomotive Magazine)
March 1896

THE COLOURS OF LOCOMOTIVES, CARRIAGES & WAGONS

. . . The next railway on our list is the Midland. About 1884 the bright green of this company's engines was replaced by the present dark red, on the score of economy. All the engines are painted the same colour, but the lining slightly varies. The passenger engines and most of the g oods have a black band with a yellow stripe on either side, the band being drawn with rounded corners. On some of the tank engines the the black band is omotted and the yellow lines are quite square, whilst on the others the band and lines are dispensed with, and the tank, splashers, cab, etc., are simply pannelled round with black and a yellow line run on the inners edge. The interior of the cab is painted and grained a light colour, and edged round on the express engines with black, having a white line inside it. The buffer beams are vermilion with the letters M.R. in gold shaded in blue. The numbers are put on in separate solid figures of brass, whilst the letters M.R. on the tender are in gold shaded with blue. The domes are painted, but the safety valve casings are bright brass. Midland carriages are dark chocolate red, pannelled round with black, the inner edge of the panels being run round with a gold stripe having a fine vermilion line on either side. The underframe is painted black withs gold stripe and thin vermilion line. The sleepers are rather gaudily painted in dark umber brown with profuse decorations in gold and scarlet, with gold lettering shaded with light blue, grey and white. For the wagon stock the Midland use a light grey with large white letters, and underframes in black.

L.B.S.C. LIVERY. (MRH JULY 1930)
Main colour - Stroudley's Improved Engine Green. Bordering and Panelling - Dark Olive Green (Saige green according to late authority) edged with black band; on green side of black band - fine red line, on yellow side white line. (Black band about ½" wide). Clothing bands - Black - red line round each edge, next to red line on either side of band i.e. on tanks, olive green stripe with white line next to yellow (body.) Wheels - Imp Eng Green with olive green tyres and axle ends. Frames, soleboard steps - claret edged all round with black band, outer edge of black band edged with fine yellow line, inner edge with fine red line. Names - Gold plain block shaded white, emerald green and fine black lines. Buffer beams - claret with bright red panel in middle which was bordered with black stripe lined yellow and red. Coupling rods claret (ends bright). Number plate - polished brass with title of railway to round border in black whilst slightly raised brass figures were on bright blue background. Polished copper chimney cap, Brass beading round cab windows. (? smokebox black).
Later:- Most engines had black frames not claret.

Lining: Attach stick to ruling pen when going round wheels etc Rotate wheels.

use tube paint thinned with turps to consistency of ink.

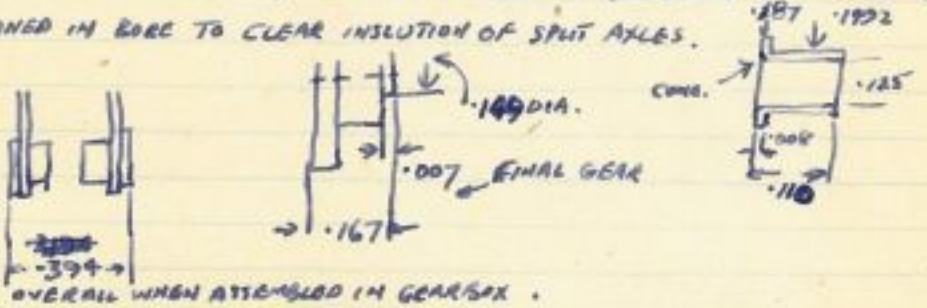
MOTORS PORTESCAP (KEAN-MAYGIS).

Fit new PB bushes at lower end of box. They are .1492" DIA TO GIVE A FORCE FIT. THEY HAVE ONLY .008 THICK FLANGE ~~(3/16" DIA AND~~ (3/16" DIA) SLIGHTLY CONED IN BORE TO CLEAR INSULATION OF SPLIT AXLES.



Also, cut back boss of final gear steel by .007" down to .150/.149 to clear the adjacent steel gear on the 3rd shaft, the ~~could~~ just be touching.

POLARITY. Loco to run forward when RIGHT HAND side wheels are POSITIVE.

MOULDING PLASTICS See under 'injection moulding'.

NICKEL PLATING.

CATHODE = NEGATIVE POLE = ARTICLE TO BE PLATED.
ANODE = POSITIVE POLE = METAL FOR DEPOSITING.
USE DRY CELLS AT 1½ VOLTS. 1 2 CELLS SUFFICIENT. WATCH CURRENT TOO STRONG CAUSES BUBBLES AT CATHODE, TOO WEAK CAUSES MILKY DEPOSIT. BEST IF HEATED TO 100°F. USE GOLD OR PLATINUM WIRE FOR BEST RESULTS. SOLDER ON TO ANODE.
1"-2" BETWEEN ANODE & CATHODE. ANODE MUST EQUAL CATHODE IN SIZE
ALLOYS MUST BE COPPER PLATED FIRST.
WHEN MAKING SOLUTION, DISSOLVE ALL SALTS EXCEPT METAL FIRST METAL SALTS LAST.

COPPER PLATING SOLUTION.

COPPER SULPHATE.	16 PARTS BY WEIGHT.
CONC. SULPHURIC ACID.	8 —— " ——
DISTILLED WATER.	128 —— " ——

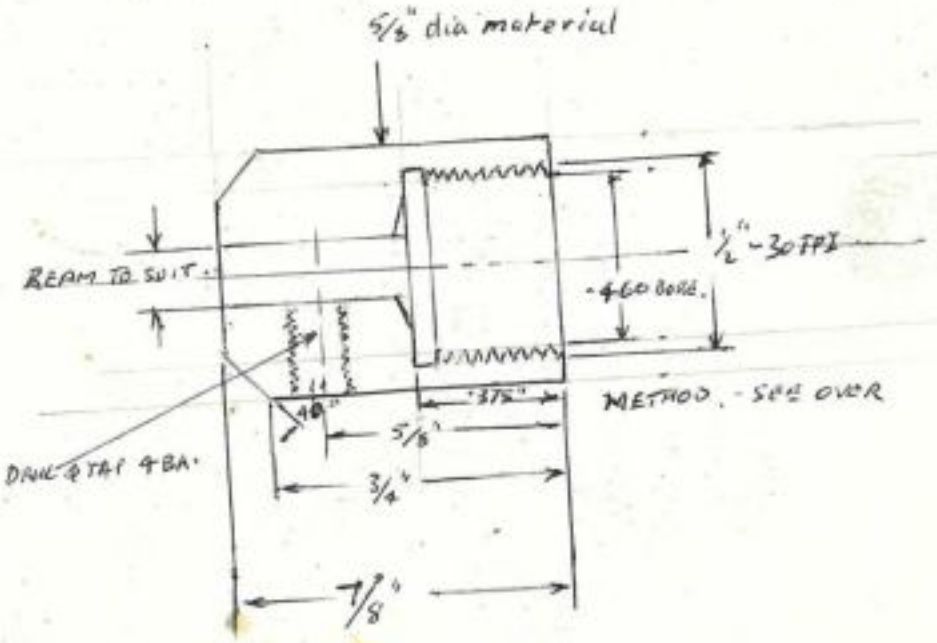
DISSOLVE THE COPPER SULPHATE IN THE HOT DISTILLED WATER & AFTER COOLING, GRADUALLY ADD THE ACID.
PURE COPPER AS ANODE.

NICKEL PLATING SOLUTION.

NICKEL SULPHATE	12 PARTS BY WEIGHT.
NICKEL CHLORIDE.	4 —— " ——
BORIC ACID, POWDER.	2 —— " ——
DISTILLED WATER.	128 —— " ——

CLEANING BEFORE PLATING.
BOIL IN SOLUTION OF CAUSTIC POTASH (1 OZ TO 1 PINT OF WATER) REMOVE WITH WIRE HOOK, WASH, DON'T TOUCH AGAIN. IF OXIDIZED, BOIL IN WEAK SOLUTION (1:10) SULPHURIC OR HYDROCHLORIC ACID.
TO STOP OFF USE ASPHALT VARNISH, MAKE SURE IT IS DRY
AFTER PLATING. BOIL IN WATER THEN DRY WHILE HOT IN SAWDUST
TIME FOR PLATING. ONE-HALF TO FIVE HOURS.

PROFILE MILLER CUTTER COLLETS.



FOR THREE.

1) 4" length EMCO MACHINED SQUARE IN ML2.
2) Knurl in front tool post ML7, PT tool in rear. Drill chuck. 3 Jaw. a) Knurl. b) Centre 3/16" c) Drill 1/4" 7/16" deep.
3) Drill .990 - 3/8 + 1/32 deep.
4) Part off (may have to saw last bit) "7/8 + 1/32" long.
5) End up in ML2 for 3rd piece.
6) Set up ML2 4 jaw to hold end piece dead true.
7) Open out to .965 right-using chuck & .465 drill as gauge and using tungsten carbide tipped boring tool with stepped end (in 'O' gauge gear box tools). Use the stepped end to undercut the bore for screwcutting and make the depth .375.
8) Recheck each one in turn and centre and drill with lathe at full speed BUT don't take out of chuck. Have the lathe set for screwcutting with tool already set. Change gears and book gears and screwcut (gears are 20/50 40/60)
9) Put each back in 4 jaw and turn other end to 7/8" length.
10) Chamfer with top slide at 40°
11) Drill end .110 for setscrew using tailstock Vee block.
12) Tap 4 BA
13) For grubscrews cutting down length in lathe if necessary
14) Number punch using sharpened nail end for dividers 1/8 1/4 etc

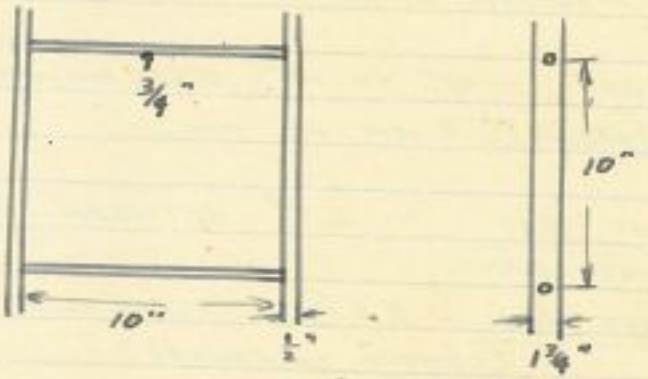
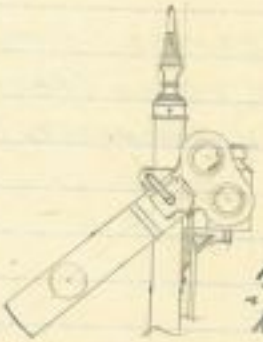
GROUND SIGNALS. SEE "G"



See Work Opp. 197

Full size signal ladder.



Midland Railway Signal. The lamps had no "bulls eye". It had a large reflector. (see later drwg.).

MIDLAND SIGNALS.

FROM DERBY MUSEUM DRAWING.

The platform lengths of bracket signals are as shown (see copy of M.E. drwgs for further data).

Signal layouts outside St Pancras.

Midland Railway Signals (Model Engineer 30/1/41) ~1900 - 1910.
Midland Signals were somewhat short. with as many arms as possible on one mast.
Fig 1 (Dwg 1) is standard arrangement of home and distant arms, (ladders omitted).
Combined bearing and stop was universal (Fig 2). permitting 45° movement of the arm. Arms were 4 feet (5 feet where long sighting was required see Fig 3) with 4 foot radius on end of home signals. All posts tapered from 7" square at top The upper part of the finial was uniform section when seen from above.
Fig 3 is a characteristic Midland arrangement - 2 distants on one post
all signals had a white disc on the face. (white line for distants according to Derby Museum?). The faces were red They were white on reverse with black spot (or bar for distant).
The back light of the lamp shines through a square aperture
all straight signals had landings and ladders even short platform stations of 15 TO 20 feet. The landing was supported by 2 diagonal stays, one to post, one to ladder. ladders were 15" wide
Bracket signals had very short dolls at 6'6" centres so no ladder was needed. and the height between arms was not very pronounced (12" see fig 4).
The cast iron platform support were standard over a wide range of platforms.
Short arms carried standard ~~pivot~~ pivot and spectacle.
Lamp suppt.

Posts - white.
Cap - Black.
Finial - white.

Back slide pivot bolt.
arm and lamp bracket
(Derby

SOLDER WITH SMALL IRON FOR BRANCHES, LARGE IRON FOR TRUNKS.
WRAP CORED SOLDER ROUND TRUNKS ALSO USE TINMAN'S SOLDER.
USE BLOWLAMP TO ENSURE SOLDER PENETRATION.
SAW OFF AT BASE, & FILE FLAT, ~~SOLDER~~ CENTRE WITH SCRIBER

Cut 3·5 mm before end ch

ENLARGE CENTRE WITH 1/8" SLOCOM IN LATHE HOLDING TRUNK BY HAND. THEN DRILL IN ABOUT 3/8" / 5/16 WITH .067 DRILL IN LATHE.
TAP 8BA. BOLT ON BASE WASHER WITH 8BA SCREW. SOLDER WASHER & WITHDRAW SCREW WHICH SHOULD HAVE BEEN OILED OR GREASED SO IT WON'T SOLDER.
TO OBTAIN A CONICAL TYPE TREE WIND THE CENTRE TRUNK FROM 2, 3 OR 4 x 8 x 6" LONG, THEN (SAY) 4 x 5", THEN 4 or 8 x 4".

NOTE:- IN MANY CASES, THE LOWEST BRANCHES COME OUT A 6' TO 8' FROM GROUND.

CAR WIRE.

44 x .0116 : (31s G). EACH STRAND OF SINGLE CABLE.

On basis of 2·4·5·16·32, this leaves 12

~~Using 32 as our branch. ad xxxtis~~

or if 16s = 2x16 = 32 leaving 12

So if we take 4 x 6" length = 4x44
= 176

This gives us 11 branches each of 16 wires.

Take (say) 6" + 5½" x 5" x 4½"

The tree will have 6" light + lower lights for the branches spreading near the ground.

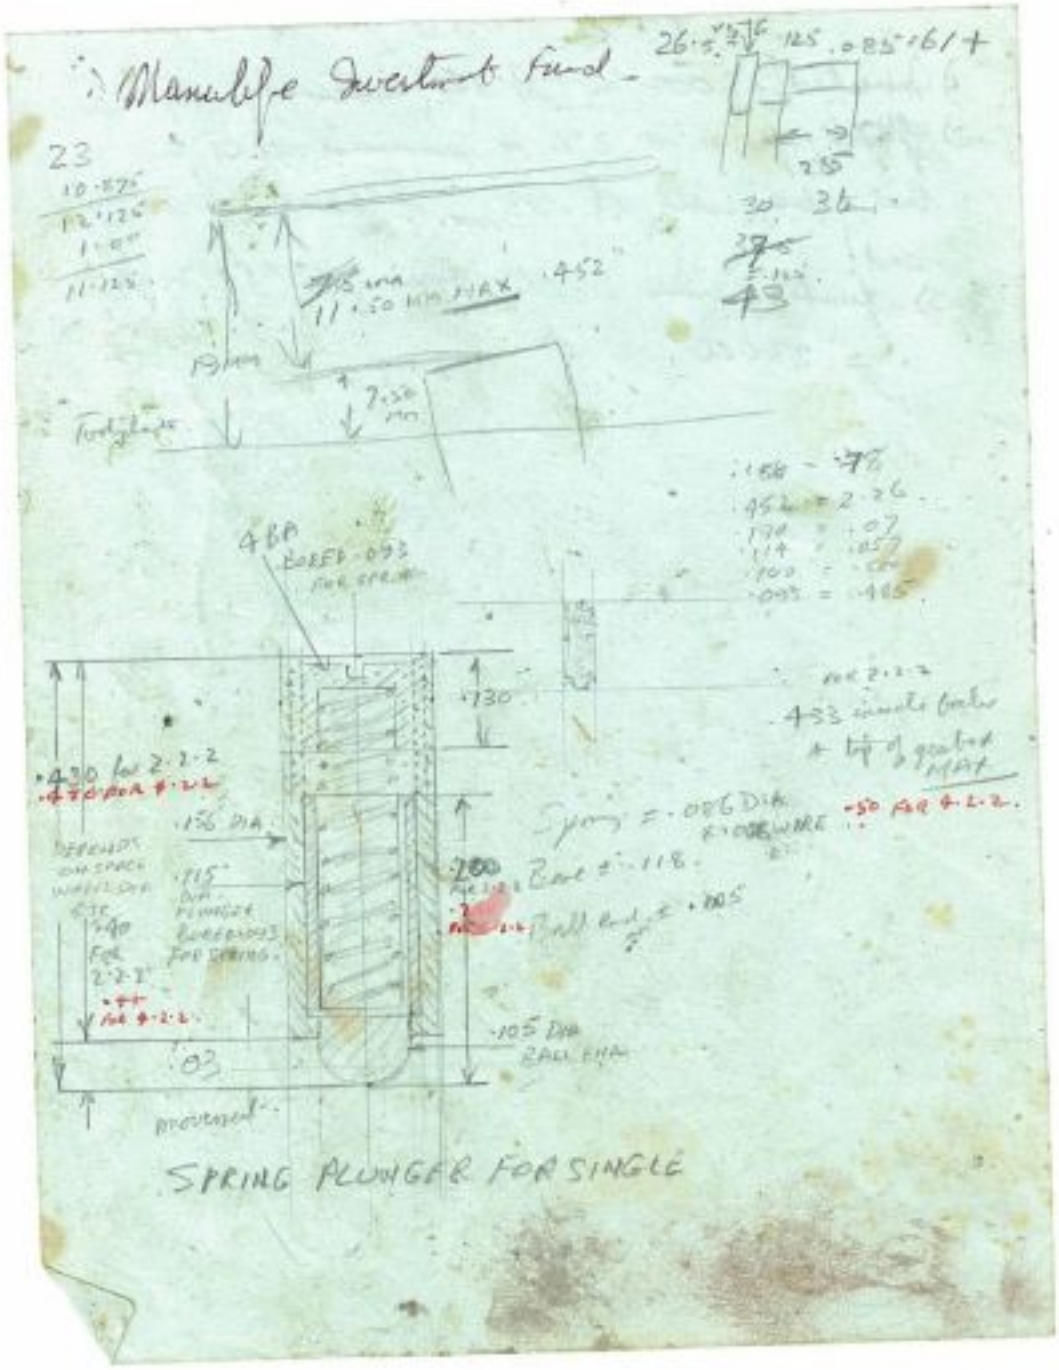
This gives a very decent tree.

~~Then~~

Each strand has 40 × .0026 (36°).
= basis of 2 - 4 - 8 - 16 - 32 strands each
This means that for 3 tranches (2 + each)
we have 3 × 32 = 96 = 120 × .0026
and 3 × 8 strands left = 24.
To make a fourth tranch, we need
another 8 strands and so, from one
cable (40 strands) we can get ~~[illegible]~~
enough for 3 tranches ~~or from 3 cables~~
~~we can get enough for 15 tranches~~
~~(5 × 8 = 120 = 3 × 40 strands)~~.

So for FOUR lengths of cable, cut FIVE
to make FOUR lots = 16 tranches and
of 32 strands = 16 × 32 = 512 strands

Proof 4 × 3 = 12 + 1 = 13 × 40 = 520
And we will have 2 cables left
= 40 × 2 = 80 strands, enough for
2 more tries.

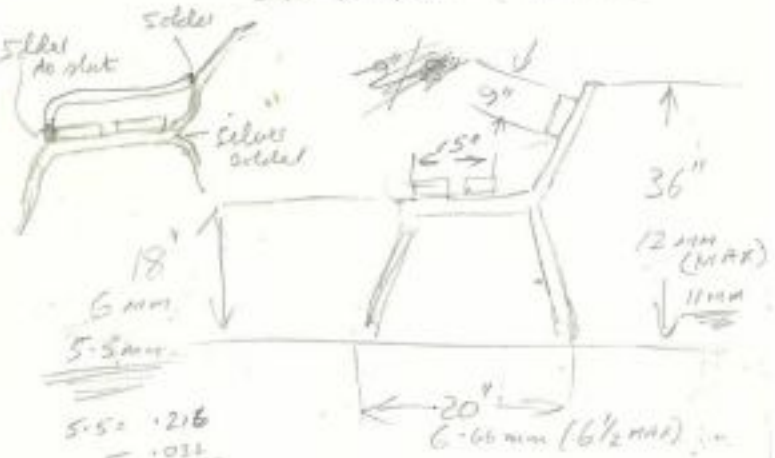


Manifold Investment Fund
SPRING PLUNGER FOR SINGLE

See plate 76 M.R. Architecture painted in a chocolate shade with white name on ultramarine panel.

II - 9

Slats Back 9" x 1⅓" = 3 mm x ·02"
Seat 6" x 1½ = 2 mm x ·02



5·5 = ·216
— ·031
·185

6½ = ·255"
— ·065"
·190

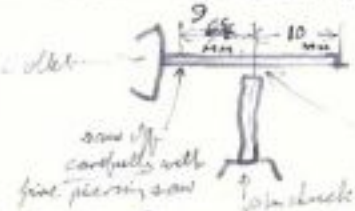
Length = 5 x seat height.
So if height = 18" = 6 mm
Length = 30 mm.

Midland Station Seats.

1) Material .0325 N/s wire and .02/.125 strip (in coil) for back rest and .023 sheet for seat.

2) Design.

3) Method. Hold one wire in ⅛" collet and one in pin chuck at right angles.



stops held in tailstock chuck. Set to 1" out. when feeding to stop, then retract stop.

The wire in the pin chuck should have end ground flat then put in vice and sawn across with piercing saw. Then filed half round to fit other wire

light candle, fill pencil torch. Heat up fluxed joint and just "dab" silver solder.

4) ~~Hold~~ Then cut off with ~~wire cutters~~ piercing saw

And cut off the 6½ mm will wire cutters.

file joint till no solder is visible gripping in small pin chuck. Also clean metal thoroughly.

3rd Bend →

4) Bend the 10mm length using flat nosed pliers

Bend the rear ~~leg~~ leg to give a curve.. Use the brass 3/16" bar with end filed to shape.

5) Take 2-30 mm lengths of .023 x 2mm and solder together with slight gap for seat

6) ~~Sit~~ Hold ~~seat~~ leg in toolmakers' clamp, bottom up. Hold ~~leg~~ seat in hand and ~~in pin chuck, tin and~~ solder to underside of seat at filed notch. Repeat at other end. Then fit middle legs.

~~Then it already has the 3rd bend in it~~

7) Bend up the remainder of the 10 mm length to form the back support-

seat

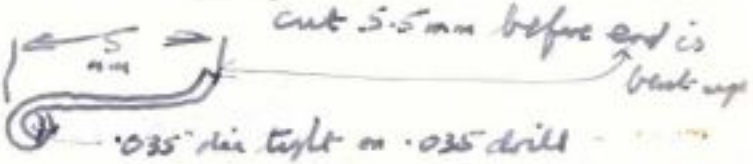
bending as close to the seat as possible using flat pliers. Finally, bend the tops of the seat supports backwards.

Hold the .02x.125 back strip in place by hand and quickly solder to one end leg. Then to the other end. Then to the middle leg.

The seat is now complete but may need a slight grind on some legs to sit "all square". Test on flat lathe bed.

OVER

8) End arms. ·02 wide strip.



Mount tight on ·035 drill in fine pin chuck, located end in slot in seat-pressbent up and against back support below the back plank and quickly solder. Then press down the end arm round end into the seat slot and solder. Withdraw drill. Hold seat by legs in clamp whilst doing this

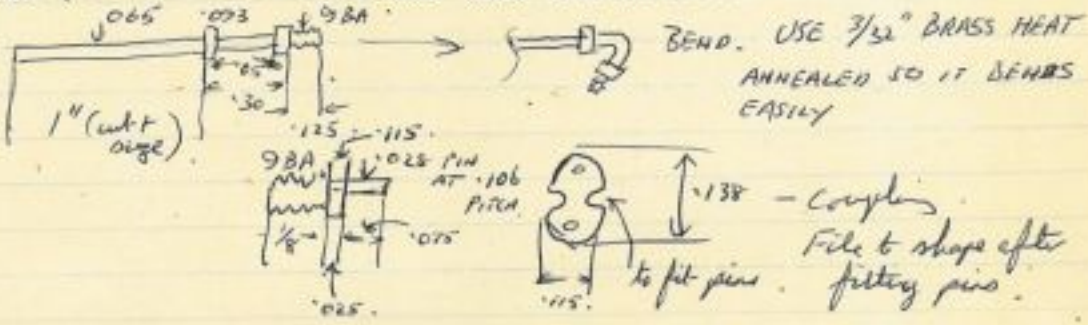
SEATS

VACUUM PIPES & TRAIN HEATING PIPES.

VACUUM PIPES '0' GAUGE (AND TRAIN HEATING PIPES)

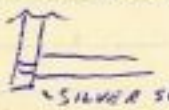
BASED ON CAVALIER COACHES DESIGN.

FLEXIBLE ARMS - ·008 SPRING WIRE WOUND ON ·051 (DRILL) MANDREL TO GIVE ·087 DIA (2mm APPROX). THESE ARE THEN SCREWED ON TO 9BA THREAD.

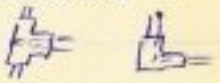


TO MODIFY CAVALIER (OR OTHER) PIPES.

CAREFULLY DRILL ·02 USING NOTCH CENTRE IN TAILSTOCK. OPEN OUT BY SUCCESSIVE DRILLS TO ·025. TAKE ·062 DIA BRASS AND TURN 'PIP' TO ·025. PUT TOGETHER AND SILVER SOLDER

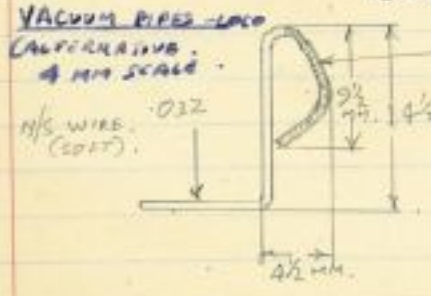


DRESS OFF TO GIVE APPEARANCE OF ELBOW OR TEE.



VACUUM PIPES - LOCO

CALIFORNIA VIVE. 4 mm SCALE.



METHOD
1) SQUARE END OF WIRE IN PIN CHUCK.
2) PLACE IN LATHE COLLET - 12 mm PROTRUDING.
3) THREAD (14 BA - DIE CLOSED IN) TO GIVE 10 mm THREAD
4) GRIP IN SMALLEST ROUND NOSE PLIERS AT SMALL END OF JAWS WITH END OF THREAD IN CENTRE OF JAW AND BEND OVER.
5) SLIGHTLY CURVE TOP THREADED PART USING ROUND NOSED PLIERS. THEN GRIP HALFWAY DOWN AND FORCE LOWER END OF THREAD (DUMMY PIPE) TIGHT ON TO UPRIGHT.
6) GRIP IN RIVETING TOOL CLAMP WITH END OF THREAD AGAINST CLAMP AND BEND OVER THE TAIL AT 90°. HAMMER DOWN AGAINST CLAMP TO GIVE A TIGHT BEND. CUT-OFF AND REPEAT.

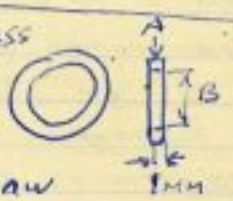
Quantity production
1). Back part a 5" length to flange depth and form.
2). Part down to ¼" with saw blade parting tool.
3). Cut off with slitting saw in chuck. (Turn between centres).

MY ARTICLE — WHEEL PRODUCTION ARTICLE. MRN JUNE/JULY 1959.

Road VEHICLE. WHEELS BRASS

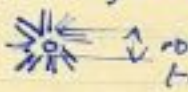


RIM 1mm wide, 1 mm thick.

	A =	B	Cu
	·364 (9·25mm)	·2854 (7·25 mm)	
	·413 (10·5mm)	·3346 (8·5mm)	

10 spokes.

Cut on ·087 mandrel in dividing head using ·017 SAW

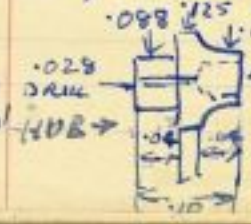


root dia = ·135 (3½mm).
top dia a force fit in rim.

OK FOR DIFFERENT SIZES & SPOKE NUMBERS.

Spokes should be sawn ·025 thick max and thinned by filing if necessary

Taper spokes by filing on mandrel AFTER sawing.



Use a fine round file ALONG spokes to thin the front edges

DRILL ·06 DIA x ·035/·04 DEEP. HUB.

Press all together then solder with solder paste + blowlamp

FILE RIM HEAD TO ·08 DIA & ·02 THK.

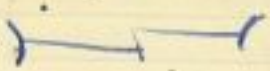
1/16" x 5/32" BRASS STRIP KEPT IN "BRASS STRIP TUBE"

Wagon modelling

Open Wagons Sides = length of wagon, Ends are wider less 2 sides thickness and go between sides. Underframes are 5/32" x 1/16" brass. Buffer beams are 1/16" x 5/32" wood. There is a jig for buffer centre holes. (22½ mm centres)
Sides are 1/32" deeper than ends and overhang floor by 1/32"
Floor = 1/8" thick by body inside dimensions. There is a jig for tapered → end timbers. Stanchions is .006 phosphor bronze (copper) wire.
(True floor thickness = 4½" ÷ 1/16 scale).

N.B. SOLDER THE SPACERS TO THE MILDWAYS IN THE JIG AND PUT THE FRAME SIDES, FITTING RAILGAUGES, SPACERS ETC. OTHERWISE YOU CAN'T GET THE JIG INTO POSITION FOR SOLDERING SPACERS

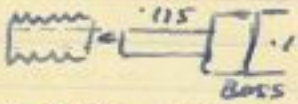
Spacer between sidebars is 24 mm. There is a jig for drilling the screw holes in spacers. Spacers 1/16" x 5/32". The jig is in fact a spare spacer.
Grind off the back of axleguard flat then drill 0.072" x 0.125" deep for bush.
Set axleguard by gauging FROM ONE END using 'L' shaped plate with divider hole in at 5mm and adding 5 mm to divider setting. GAUGE A 'RIGHT' & 'LEFT' sidebar from 'SAME' end. Then set wheel centre by trammels.
Clamp to a piece of wood whilst sawing the stretchers to part the frames.
Thin ends of sidebars if necessary to fit 10BA nuts for buffers.
Brakes. There is a clamping jig for filing shoes and slitting hook. Kept with shoes in tube
Brake levers from 0.09" strip filed down to taper in jig.
Pull rods from 0.02" strip. Brake pin drawing of bracket from 0.03" strip filed to recess cut in top of sidebar. Retaining hangers from 0.02" strip.
To allow for rather high 'V' iron centre, fit brakes thus:-



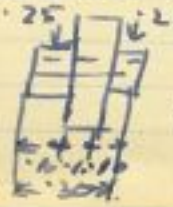
This angles the lower levers up and flattens the upper levers.

WORMS & WHEELS

2 BA. USE 2BA ROD FOR .071 MOTOR SHAFT WITH BOSS TURNED DOWN TO .145". THIS WILL ACCEPT A 10BA GRUBSCREW (.067 STEEL ROD THREADED).
IF 3/32" SHAFT. IT WILL BE SIMPLEST TO BORE .125 & FIT A BUSH TO GIVE.
THE BOSS



THE WHEEL IS BRASS. SINK CUTTER IN .015. SINK 2BA TAP IN .020.



USE SMALL CUTTER WITH 2/8 SHANK ARBOR. MOUNT WHEEL ON .125 ARBOR. BOTH ARBORS IN TOOL POST.

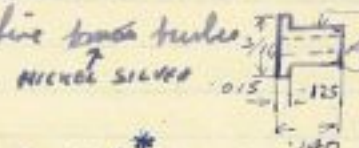
	TOP DIA.	PCD.	
60°	.628	.603	HELIX = 3°30'
50°	.547	.508	
40°	.425	.406.	

WASHOUT PLUGS. LMS & BR don't have round nose. Drill .04" Back with lead. Drill .016. Sharpen piece of .016 wire. Recess .016 tube at rear of lead if one can. Press in pin flush. Secure rear with CYANO or DEVCON (or solder). Snip off excess inside

WHEELS – PLASTIC – SHRINKING. (ACTUAL TIME – 5 HOURS FOR EIGHT WHEELS).

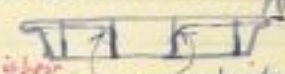
16 mm GIBSON 12 SPOKE. – .120" BORE FOR .115" AXLE. .110 THO' BOSS. FLUSH AT BACK

1) Machine bush in turning



Put a decent lead* on for fitting and initial bore to .078 to ease final machining.

2). With Eclipse hacksaw cut across back of flange and along spoke don't be afraid to go halfway through flange. Use a knife file edge to clean out slot well. Also round off the slot into the bore with a fine, square file.



3) Cut strips of .002/.003 ~~tomorrow~~ brass with scalpel .02/.015 wide.

4) ~~Solder to each rim slot and cut off to overlap bore by .06~~ YES SOLDER BEFORE PRESSING IN BUSH

5) Bend with into bore. PUT ARALDITE IN BORE, ROUND BOSS AND ALONG SPOKE

6) Drive in bush, supporting the wheel by the boss USING FINGER CLAMP AS PREV

7) ~~Put Cyano glue on three strips and bend back flange~~ Gently drive the bush home using a steel ~~stop~~ strip with ~~a hole~~ 0.135" hole for the projecting bush to go in USE A ZRA OR 6BA WASHER AS 'HOLE' TO FEED INTO.

8) CAREFULLY face off the solder flush on the bush in the lathe (don't face right down to the plastic or the strip may tear away) Then face the centre flange down to .01 proud of rim.

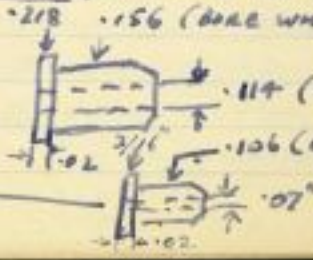
9) Bore with sharp single point tool. .0005 ±0 below axle size

10) NOTE. IF WE HAVE TO DRILL A BUSH WHEN IN THE WHEEL, USE A SHARP DRILL AND PUT SOME DRAG ON TAILSTOCK, OTHERWISE THE DRILL WILL SNATCH & SPLIT BUSH OUT.

BUSHES FOR 1/8" AXLES

NICKEL SILVER.

FOR 2MM (.0787")



LATER NOTES IN RED

* Important

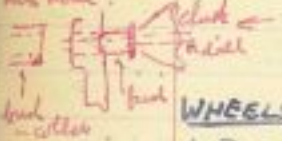
MAKE THE LEAD A GOOD ONE ALSO ROUND THE SLOT WALL OTHERWISE THE BUSH SHEARS OFF THE LEAD ENDS IN THE BORE

LATER

BEND THE TWO STRIPS ABOUT 1/16" AND HOOK OR INTO BORE HOLDING IN PLACE BY ARALDITE ALONG BACKS OF SPOKES THEN PRESS IN BUSH BY HAND AND USING FINGER CLAMP IN VICE PRESS BUSH HOME WITH WASHER BELOW TO TAKE PROJECTION ON FINAL PRESS THEN PRESS DOWN STRIP ON TO ARALDITE CRIMP OVER RIM AND SOLDER.

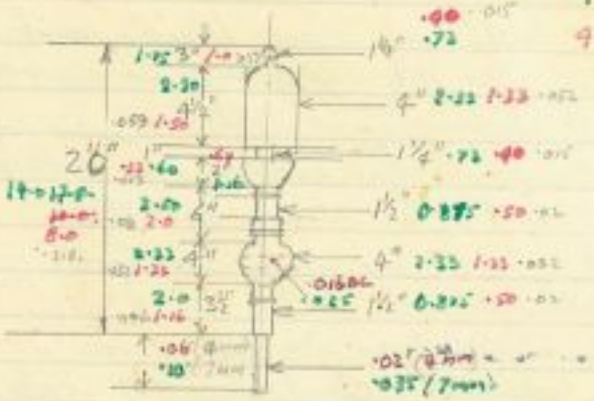
TRACTION WHEELS.

1) Mark strip where using fine plier
2) Hold one strip in vice, press down on A with side and SOLDER in vice
3) Cut off spare strip and repeat 2.
4) Place a bush (·138 bore (wash) in collet. Place short drill shank (·030 dia) in tailstock chuck, thread a short rod from back home.



WHISTLES (MIDLAND).

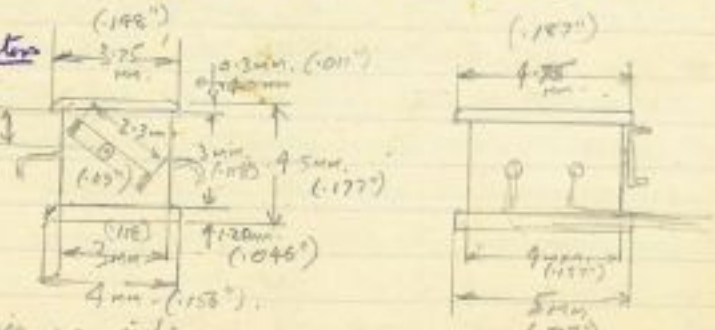
7 MM SCALE (MM).
9 MM SCALE (MM).



WHEELS ROMFORD - RE-MACHINING.

1) Bore with fine tool from back either 3/16" or 5/32" depending on diameter of axle.
2) Bush with 3/16" M.S. turned down to 5/32" if need be plus ·001 a bore for fit.
3) Cut off the bar leaving a 1/16" protrusion for chucking in 3/16" collet.
4) Part rim off from front.
5) Use TWO TURNS of ·0005 coms foil as packing and refit rim with back of wheel onto against collet bush in lathe and with flat face against poppet.
6) Chuck by 3/16" spigot and turn wheel front and flange as desired FILE RADIUS ON FLANGE
7) Hold in vice chuck and turn back to give ·08 thickness at ·017 flange thickness.
8) Bore from back to ·124 for 1/8" axle or ·114 if 5/32" bush is used.
9) Turn axles to ·114 +·0005 force if necessary or file 1/8" axles to ·0005 force fit (taper). Time Two per hour price £2.

Wakefield Lubricator



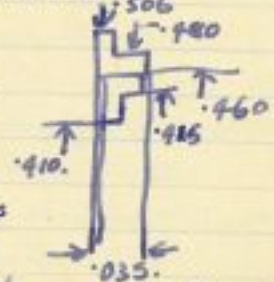
4 MM Scale.

Only TWO pairs per side.
This is the type fitted to ex-Midland Compounds and on the left hand side only. It is NOT the same as those fitted to later LMS and Stanier Engines.

Wheels Alan Harris - Turning

Use ML7 lathe and 3 jaw. Always mark the jaw position using a marking pen. N.B. The castings are absolutely concentric

1). Chuck on turning spigot .4375.
2). Hold by spigot, face boss and rim - centre boss - mark jaw. - also turn top to flange dia and treat
3) Reverse - chuck by rim and turn back.
4) Recheck on spigot, use centre, turn form.
5) Cut off spigot
6) Recheck and drill bore .172 FOR .1875 axle or .140 for .156 axle (bogie, trucks)
7) Chuck in collet chuck in ML7, check for true the bore .1875 (or ream or D bit
Further notes. Cut Balance weights, fit with araldite.
Drill .067 for work in the use/.1875 arbor (in crankpin box) to drill the rest.
Open out to .093 using jiller drill. Centre all axles (.03"). Press on hub and quarter Before painting. Use paper shield Behind wheels and spray frame. If axles are to be left bright, spray wheels Bearec fitting
See 'Crankpins' IN REG N.B. .093 material x 10 BA

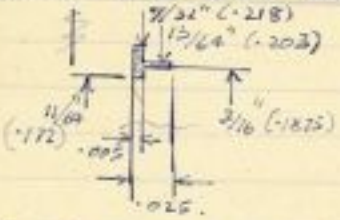


WINDOWS - CAB - "O" GAUGE ASPINAL 4-4-0.
The outer ring is STEEL, inner - BRASS.
I turn a STEEL tube in 4 jaw to .520 outside x .460 inside. I turn a BRASS push to .460 outside x .375" inside.
Force BRASS push into STEEL push will locate the turn outer STEEL to .506 and bore inner BRASS to .410. Using a SHARP boring tool, set well out from tool post, just touch up to .410 face the cut in from face by .003" to .460 to give the slight inset of BRASS. Then reset in to .025 x .415 to take glass. THEN PUT LATHE IN REVERSE AND CUT IN .025 DOWN TO .480 FROM REAR TO GIVE RECESS ON STEEL. TRY TO PART OFF BUT, IF NOT SUCCESSFULL, CUT OFF WITH HACKSAW. Reverse in collet chuck and face back using the boring tool as, again, recess steel in by .003
To cut hole in cab front, set boring bar to give .480 dia cut, using a piece of .012 x .75 brass with a .25 hole, thread tool through .25 hole in apex plate, clamp to turn backing and trepan hole out. For windows, use .415 punch and .01 plastic sheet.

WHEEL STANDARDS.

	A	B	C	D.	E.
MY OWN EM.	·079".	·017"	·028"	·01"	·01"
P4	·073"/·073"	·017"/·016"	·016"	·01"	·01"
"O" G.GUILD.	·122"/·157"	·03"/·04"	·047"/·047"	·027"/·028"	·01"

WINDOWS - CAR 4 MM MIDLAND.



On theory, we need ·187" dia glazing. But, in fact, it is not easy to cut this exactly. Therefore, there are 3 punches 4·5mm (·177). 4·60mm (·181") & 4·70 mm (·185 mm). The ·185 JUST forces in. Lets with varnish. Cut by using finger clamp in vice as press with plastic backed by card for the punch to press into.

WINDOW LOCKS (CHUBB BOLT) MODIFICATIONS.

1). Turn down square end, cutting away the screw until overall length of square portion is ·218". This makes the screw flush with the thread inside the brass bush. File the turned length to match existing square and turn away the end of the square until it measures ·160" long.

2) Drill square axially ·076" dia (1·9mm) x ·130" deep.

3) Make ⅛" Dia silver steel stub

4) File slight air relief flat and drive stub into end of square

5) Drill key ·134 (3·4mm) x ·125" ~~long~~ deep.
